

Operational guidelines and testing protocols for coworkers joining the parametric insurance grid testing phase.

1. Phased Sandbox Testing Roadmap

- **Phase A (Greg Only):** Firebase Auth blocks all logins except Greg's credentials. Live address validation and coordinates drift tests are run in absolute isolation.
- **Phase B (Co-Founder Audit):** Add co-founder credentials. Run mock checkout webhook triggers and multi-sig payouts.
- **Phase C (Department Sandbox):** Access granted to Actuarial and Compliance teams, writing only to a sandboxed `/sandbox` folder in Firestore.
- **Phase D (Full Team Launch):** General deployment to coworkers with Google OAuth roles.

2. System Fail-Safes & Error Handling

THE ADVERSE NON-AUTOMATION RULE

By base code design, the AI Agents cannot execute autonomous adverse claim actions (denials or cancellations) under NY/FL state laws. When a data mismatch occurs, the agent halts, flags the file, and hands it off to a licensed human Integrity Officer.

3. Job Code Testing Targets

- **CEO:** Focuses on multi-signature sequences, treasury ledgers, and cash asset parity.
- **COO:** Evaluates checkout webhooks, hardware delivery tracking, and device MAC pairing validations.
- **CRO / Legal:** Verifies Zero-Knowledge privacy proofs and automated state reports.
- **Actuaries:** Monitors coordinate drift triggers and risk pricing correctness.
