

Welcome to the Engine Room!

Welcome! If you are stepping into the **Product Manager** role, you are the bridge between the visionary Product Owner and the engineering teams (and AI agents!) that actually build the system.

If the Product Owner decides **where** the ship is going, you are the captain deciding **how** we get there safely and efficiently.

Understanding the Machine

You don't need to write code, but you do need to understand how our five core components fit together:

1. **Customer App:** The front door. It must look premium (we use a Dark Mode & Gold aesthetic) so customers trust us.
2. **Enterprise Dashboard:** Your primary tool. This is where you monitor the health of the system.
3. **Nexus Core:** This handles incoming customers. It contains our Underwriting AI.
4. **Quant Brain:** This handles our money. It contains our Actuary AI.
5. **Vigilance Grid:** This handles the weather data. It contains our Oracle AI.

Managing the AI Workforce

Unlike a traditional software company where you only manage human developers, at Chainmail, you manage a team of four autonomous AI Agents. You need to know their "job descriptions":

- **The Underwriting Agent:** Evaluates new properties. **Your role:** You can inject "Carrier Rulesets" through the Enterprise dashboard to tell this AI how to behave (e.g., "Stop taking policies in Florida this week").
- **The Claims Verification Agent:** Reviews disaster photos and approves payouts. **Your role:** Monitor its confidence scores. If it sends too many claims to human review, you need to ask the engineers to tune its prompt.
- **The Vigilance Oracle Agent:** Watches global weather to pre-authorize claims. **Your role:** Ensure the telemetry feeds (like NOAA) are online so this AI isn't flying blind.

- **The Quant Brain Actuary Agent:** Buys reinsurance to protect our cash. **Your role:** Keep an eye on its spending limits.

Your Day-to-Day Execution

- **Jira Tracking:** You will live in Jira. We organize our work into Epics (e.g., "automated execution rules", "State Compliance"). You break the Product Owner's big ideas down into small tickets for the engineers.
- **Monitor the Audit Logs:** The AI agents log every single decision they make, along with how much money that decision cost in API fees. You will use the Enterprise Dashboard's "Audit Analysis" tab to ensure the AI isn't going rogue or burning too much cash.
- **Protect the Philosophy:** Chainmail is built to **embrace risk** and support the community (the BallPark Initiative). When you write requirements for the engineers, make sure the system defaults to helping the customer, not blocking them.

You are the operational glue that holds Chainmail together. Let's get to work!
