

## 1. Welcome to the Engine Room!

Welcome! As a **Product Manager**, you are the bridge between the visionary Product Owner and the engineering teams (and AI agents!) that actually build the system. If the Product Owner decides *where* the ship is going, you are the captain deciding *how* we get there safely and efficiently.

## 2. Understanding the Machine

You don't need to write code, but you do need to understand how our five core components fit together:

- **Customer App:** The front door. It must look premium (Steel & Glass aesthetic) so customers trust us.
- **Enterprise Dashboard:** Your primary tool. This is where you monitor the health of the system.
- **Nexus Core:** This handles incoming customers and contains our Underwriting AI.
- **Quant Brain:** This handles our money and contains our Actuary AI.
- **Vigilance Grid:** This handles the weather data and contains our Oracle AI.

## 3. Managing the AI Workforce

You manage a team of four autonomous AI Agents. You need to know their operational limits:

- **Underwriting Agent:** Evaluates new properties. You can inject "Carrier Rulesets" through the Enterprise dashboard to restrict risk limits in active storm paths.
- **Claims Verification Agent:** Reviews photos and approves payouts. You monitor its confidence scores. If it routes too many claims to human review, prompt tuning is required.
- **Vigilance Oracle Agent:** Watches telemetry feeds. You ensure API connections (like NOAA) are online.
- **Quant Brain Actuary Agent:** Buys reinsurance. You monitor its spending limits.

## 4. Your Day-to-Day Execution

- **Jira Tracking:** You organize work into Epics (e.g. "automated execution rules", "State Compliance"), breaking them down into tickets for developers.

- **Audit Logs:** AI agents log every decision and its API cost. You inspect these to ensure safety and budget efficiency.
- **Protect the Philosophy:** Ensure the system defaults to helping the customer, never blocking them, supporting the BallPark Initiative.
